

## "Which Chew Should You Choose?"

In my science project I wanted to know which gum would have the longest lasting taste.

My guess was that the more it costs, the longer the taste will last.

How I tested my hypothesis:

1. My dad and I went to Alberton's and purchased seven different packages of gum at different prices.
2. My dad, my sister, and I chewed the same gum and timed how long each of us thought the flavor lasted. When the taste was gone, we ate a cracker and drank some water.
3. I made a chart and wrote down :  
What gum we chewed  
The time we began to chew  
The time each of us thought the gum lost its flavor  
I calculated how long each of us thought the flavor lasted.
4. I then took the times I had gathered for each gum and calculated the average time the flavor lasted for each gum.

My hypothesis was wrong. The cost of the gum had nothing to do with how long the taste lasted.
